this standard is made in an API product specification and to those components for which the methods of this standard are required or permitted. This standard is based on ASME Boiler and Pressure Vessel Code, Section VIII, Division 2, Appendix 4 (2004 edition with 2005 and 2006 addenda) but includes

□ API 6A, 16A, and 16C reference the ASME Code Section VIII Division 2, 2004 Edition, Appendix 4 as one acceptable method for design verification. Since referencing an obsolete spec is awkward, an Annex (Annex I) was prepared for 16A capturing the method from that ASME Appendix.

API Standard 6X: API/ASME. 3. screwed-in plugs. For hydrostatic test conditions shear stress is limited to 0.1 Special stress limits Bearing Stress Bearing stress is allowed to exceed the yield strength of the material provided that the other stresses in the vicinity of the bearing load are within acceptable limits.

API has adopted slightly different stress limits from the ASME Boiler and Pressure Vessel Code, 2004. The criteria used assume defect-free, tough, and ductile material behavior. Fatigue analysis is outside the scope of this document. Bolting allowable stresses are given in API product specifications and are outside the scope of this document.

API's Standards Committees are made up of subcommittees and task groups comprised of industry experts who develop API standards. These groups identify the need, then develop, approve, and revise standards and other technical publications. New projects must be justified by valid business and safety needs. The standards-writing subcommittees and task groups are open to representatives of ...

Further clarification/history: API 6AX does not exist. There are API 6A and API 6X. API 6A references the 2004 version (with 2005 and 2006 addenda) of ASME BPVC Section VIII Div 2. This is because the API 6A committee members did not like the changes in the 2007 edition, so they referenced the earlier edition.
