Basically on power-up I look to see if the 'learn' button is pressed. If it is I read the RF module and look for repeating codes (the doorbell push sends the same code around 12 times every time you press the doorbell). Once a repeating code is found I store this in NVR. Then the arduino continuously scans the RF module for the pattern.

XD-FST FS1000A at 5v. XD-FST FS1000A at 12v. The Wireless-Tag RF-T-ASK module, having not

known its true voltage range, was observed to latch into continuous output above 10v, heating up the module significantly. However, the module had the best power output, at 5v, it was about 3dB ahead of the Summitek and 6dB ahead of the FS1000A.
