Offshore (Submarine) Pipeline; It covers all pipelines in offshore areas beyond the line of ordinary high water, along that portion of the coast that is in direct contact with the open seas and beyond the line marking the seaward limit of inland coastal waters.

1.1. Use of subsea pipelines. Offshore pipelines are a main part of any offshore oil and gas project. Marine pipelines transport oil and gas from subsea wells to the platform and subsequently gas or oil from the platform to the coast for further process and distribution. There are also large pipeline for the transportation of gas or oil from one country to another.

et al., 2003). The first offshore pipeline was born in the Summerland, an idyllic-sounding spot just southeast of Santa Barbara. Since then the offshore pipeline has become the unique means of efficiently transporting offshore fluids, i.e., oil, gas, and water. Offshore pipelines can be classified as follows (Figure 1.1):

Offshore steel pipelines are normally designed for a life ranging from 10 years to 40 years. To enable the pipeline to last for the design life, the pipeline needs to be protected from corrosion both internally and externally. Internal corrosion is related to fluid that is carried by the pipeline, and this topic is not covered here.

This post covers topics related to offshore pipelines requirements, pipelines and design activities to be performed by Pipeline engineer. 1. Why Pipelines are required? 1. The oil spillage through pipelines is less than any other sources. 2.

Introduction to Subsea Pipelines. Offshore oil and gas production platforms export their hydrocarbons ashore through subsea pipelines buried beneath the sand and sediment under the seabed. Before the pipelines are laid they are subjected to a rigorous system of anti-corrosion measures appropriate to the environment in which they are located.
