### **Introductory Combinatorics Richard A Brualdi**

In mathematics, a combination is a selection of items from a collection, such that (unlike permutations) the order of selection does not matter. For example, given three fruits, say an apple, an orange and a pear, there are three combinations of two that can be drawn from this set: an apple and a pear; an apple and an orange; or a pear and an orange.

### **Combination - Wikipedia**

If one sees a number as a set of its prime factors, then  $(**)$  is a generalization of Möbius inversion formula for square-free natural numbers. Therefore,  $(**)$  is seen as the Möbius inversion formula for the incidence algebra of the partially ordered set of all subsets of  $A$ . For a generalization of the full version of Möbius inversion formula,  $(**)$  must be generalized to multisets.

### **Inclusion-exclusion principle - Wikipedia**
