Covalent Bonds. Covalent bonds form when atoms share electrons. Hydrogen is a first shell element with only one valence electron, so it can only form one bond creating a duet, an exception to the octet rule. With its four valence electrons, carbon can form four bonds to create an octet. Normally two electrons pairs up and forms a bond, e.g ...

About Covalent and Ionic Bonds. The covalent bond is formed when two atoms are able to share electrons whereas the ionic bond is formed when the "sharing" is so unequal that an electron from atom A is completely lost to atom B, resulting in a pair of ions.

### Writing & Naming Formulas of Ionic & Covalent Compounds

The two main types of chemical bonds are ionic and covalent bonds. An ionic bond essentially donates an electron to the other atom participating in the bond, while electrons in a covalent bond are shared equally between the atoms. The only pure covalent bonds occur between identical atoms.

### Ionic vs Covalent Bonds - Understand the Difference

Covalent bonds are awesome, because they allow for a vast variety of compounds, much more than ionic bonds. Because of covalent bonding we have things like water (H<sub>2</sub>O), carbon dioxide (CO<sub>2</sub>), the kind of alcohol that people drink (C<sub>2</sub>H<sub>5</sub>OH), and even larger compounds like aspirin, estrogen, and testosterone.
